**Introduction**

Homoeopathic paediatrics is the emerging field of homoeopathy. As a homoeopathic paediatric physician our aim should be to restore the sick children to health, to cure as early as possible. In this case series we wish to present the scope of Homoeopathic medicine in Nocturnal enuresis. This common paediatric condition is not life threatening but it develops some psychological and emotional stress in the children suffering from **primary nocturnal enuresis**. Enuresis is defined as voluntary or involuntary repeated discharge of urine in cloths or on bed after developmental age when bladder control should have been established. Nocturnal Enuresis is classified as the Primary (Persistent) type and Secondary (regressive) type. Primary Nocturnal (voiding urine at night) Enuresis (PNE) is most common in occurrence of involuntary voiding at night after 5 years of age. It is the age when volitional control of micturition is expected to have been established. According to modern medicine the management of the child with enuresis should begin with behavioural therapy and Pharmacotherapy as 2nd line of treatment. Homoeopathic management of Nocturnal enuresis should focus on understanding of child as whole, with the help of behavioural therapy to arrive at cure.

**Abstract**

Techniques and practical guidance for homoeopathic intervention during present scenario of pandemic COVID -19 are discussed, in addition guidelines for how to carry homoeopathic research, few remedies are provided for symptom groups for this pandemic disease.

**Conclusion :**

The conducting of clinical research for testing scope of homoeopathic Intervention during epidemic is challenging. This COVID – 19 pandemic is over the world now demands need of homoeopathic intervention with improved research infrastructure. To address this need, a training curriculum, clinical Research during Outbreaks of COVID – 19 should be jointly developed by the Special Programme for Research and Training Curriculum is main objective of this training curriculum is to strengthen the national capacities of health authorities to design and implement clinical research during outbreaks of infectious diseases and to improve team capacity and team effort.
